

Basic

```
<?xml version="1.0"?>
<complete >
  <option value="1">One</option>           one tag, for one option
  <option value="2">Two</option>
  <option value="3">Three</option>
</complete>
```

Full

```
<?xml version="1.0" encoding="iso-8859-1"?>           encoding can be important
<complete add="true">
  <option value="1">One</option>
  <option value="2" css="font-weight:bold;">Two</option>  custom css style
  <option value="3" img_src="some.gif">Three</option>
  <option value="4"><![CDATA[
    <strong>four</strong>                                by using CDATA
                                                         option text with HTML formatting
                                                         can be set
  ]]></option>
</complete>
```

complete	just top xml tag, has no special meaning
add	If attribute exists - options from XML will be added to existing list, in other case, all previous options will be deleted
option	represent option of combobox Content of tag used as option label
css	any css text, which need to be applied to option in question
img	for combo with images , this attribute contains url to image related to option (if none set, default image will be used) has no sense for combo in default mode (without images)
value	value for related option if skipped - value will be set the same as option's label can contain any HTML, while it correctly escaped
